

SAHIBINDENApplication - Database Setup Instructions

Please follow the instructions below to successfully import the PostgreSQL database for the SAHIBINDENApplication project using DBeaver.

1. Restoring the Database Backup (.backup file)

1. Open DBeaver and connect to your local PostgreSQL server.
2. Right-click on the 'Databases' folder in the Database Navigator and select Create New Database. You can name the database sahibinden_db.
3. Right-click the newly created database, hover over Tools, and select Restore.
4. Under the 'Input file' section, click the folder icon and locate the provided .backup file included in the project submission.
5. Click Start to run the restore process.
6. Once the restore is complete, right-click the database and select Refresh to view all imported tables and data.

2. Important Note Regarding Listing Images

Please note that no listing photos will be visible, and the **listing_images** table has been left empty in this backup.

Reason: The application currently stores absolute local file paths for images. Because these paths are uniquely tied to the local directory structure of my development machine, they would result in broken file paths and missing images when run on a different computer. To prevent errors and ensure the application runs smoothly on your machine, the images have been omitted from this database dump.

3. Application Test Accounts

To easily test the application, you can log in using any of the following pre-configured accounts:

Username	Password	Role / Access Level
admin	12345678a	Admin
admin_second	12345678a2	Admin
moo	12345678m	Standard User
testuser	12345678t	Standard User

These accounts will allow you to explore both the standard user interface and the administrative dashboards.
